#### (54) Improvements in or relating to security systems

The invention consists of attaching or embedding a "TIRIS" transponder (or other RF or IR or barcode or other identifying device) physically into the center of the proposed DVD disk. Once a disk is input to a media player, the interrogation portion of the media player transmits an interrogation signal to the transponder located on the disk. Once empowered with the interrogation signal, the transponder accesses the predetermined address, code word, encryption algorithms. media type information, and copyright information from it's memory. Then the transponder transmits the address, the code word, encryption algorithms, media type information and copyright information to the interrogator, located within the media player, and the interrogator sends the transponder data stream to a conditional access management processor(CAMP)... Simultaneously with the processing action of the CAMP, the interrogator instructs the player to access the data\_word at the predetermined address on the disk and the player accesses the data\_word on the disk. The media player only plays if there is a match between the read data\_word and received code word and the received algorithm correctly decrypts the content of the media prior to decoding.

# ANNEX TO THE EUROPEAN SEARCH REPORT ON EUROPEAN PATENT APPLICATION NO.

EP 97 12 2526

This annex lists the patent family members relating to the patent documents cited in the above-mentioned European search report. The members are as contained in the European Patent Office EDP (tile on The European Patent Office is in no way liable for these particulars which are merely given for the purpose of information.
